0.1 `ternarypoints`: Adding Points to Ternary Diagrams

Description

Use `ternarypoints` to add points to a ternary diagram generated using the `ternaryplot` function in the vcd library. Use ternary diagrams to plot expected values for multinomial choice models with three categories in the dependent variable.

Usage

```
ternarypoints(object, pch = 19, col = "blue", ...)
```

Arguments

`object`	The input object must be a matrix with three columns.
`pch`	The selected type of point. By default, `pch = 19`, solid disks.
`col`	The color of the points. By default, `col = "blue"`.
`...`	Additional parameters passed to `points`.

Value

The `ternarypoints` command adds points to a previously existing ternary diagram. Use `ternaryplot` in the `vcd` library to generate the main ternary diagram.
